反转链表I

反转一个单链表。

(https://leetcode-cn.com/problems/reverse-linked-list/description)

```
public ListNode reverseList(ListNode head) {
   if (head == null || head.next == null){
      return head;
   }
   ListNode prev = null;
   while (head != null) {
      ListNode temp = head.next;
      head.next = prev;
      prev = head;
      head = temp;
   }
   return prev;
}
```

反转链表 II

反转从位置m到n的链表。用一次遍历在原地完成反转。

例如:

给定 1->2->3->4->5->NULL, m = 2 和 n = 4,

返回 1->4->3->2->5->NULL.

注意:

给定 m, n满足以下条件:

1 ≤ m ≤ n ≤ 列表长度
